After the first correction, we started to discuss which are going to be the requirements for this project. Following this, we made a huge analysis of the business, how they work, the infrastructure they have and what type of application they want to have

First the server, it must be efficient because it is going to host the database, the application and more things, so it is an important part of the Project. What is more, the server is going to have some scripts that make easier the job to the administrator.

Second, the application, which is the most important part of the development because it takes a lot of time to develop it and is the face of the Project, so we had to ask a lot of questions to the client and also to us to know what we are going to do.

Third, the database, this will save all information which we consider is important to the development of the Project such as users, cars, drivers, etc.

In conclusion, there are more parts to emphasize, but we have to consider that all of them will be useless if we do not join them to do the project itself, so these parts are the most important to make a good Project.
